

About one year ago we started working on perfecting the CarbaCap. The CarbaCap is based on old technology, however it needed to be improved. As the manufacturer we were working with a mold that became increasingly unreliable. The proprietary 3M product we were making the CarbaCap from was actually corroding the mold. We went through an extensive refurbishment of the mold and also tested out different types of materials. We quickly discovered that the material we were using was not able to be reliable through the manufacturing process. The old plastic we were making the CarbaCap with had a tendency to shrink when it cooled. This had a tendency to leave ripples in critical areas that would cause it to fail during its manufacturing. There were new space age plastics that would work better and be far more reliable. For over a year we explored new options on making the best possible product we could.

Working with our molding and plastic provider we discovered that a new type of plastic known as K-Resin® would work with our mold and decrease the shrinkage and defects. This made the CarbaCap the correct size and fitted tightly within the injector and on the container. We feel that this will improve the quality of the CarbaCap and will help users maintain a **good and tight** seal. At first we jokingly refer to this as Gütentite Technology™. However it's more than just a twist on an old product. This improvement will revolutionize the reliability of carbonating at home or at the industrial level. This new type of plastic should last for many years of reliable use. Even though the CarbaCap is fully warranted for life, this will give even more confidence in the reliability of our products.

Sometimes innovations and improvements on old technology can make a big difference. We hope that the CarbaCap with the new Gütentite Technology™ improvements will provide our customers with exceptional, reliable and durable use for many years to come. Other similar products on the market have come and gone with a fad enthusiasm. We are confident that the CarbaCap will be here for many years to come with an ever-growing list of satisfied users from around the world.
